WILLIAM K. CHEUNG PRIMARY EXAMINER

9/2/07

Continuation of 11. does NOT place the application in condition for allowance because: although applicants continue to argue that the prior art does not teach the "root mean square surface roughness less thatn about 120 micro inches", applicants must recognize that the prior art, Rohlfing et al. (col. 1, line 61-64; col. 6, claim 3) clearly teach one of ordinary skill in art to employ a loop reactor having a reactor zone (inner surfaces) with a smooth surface, or a surface as smooth as possible to reduce fouling. Further, applicants must recognize that if the prior art possess the "root mean square surface roughness" as claimed, the rejection would be a 102 rejection, not a 103 rejection as set forth June 18, 2007. Regarding applicants' argument that applicants' specification (page 7, paragraph 28) states that "known slurry loop reactors have root mean square surface values of 125 or greater micro inches, applicants must recognize that applicants' specification can not be used to modify the teachings of a prior art. The examiner acknowledges applicants' disagreement that the rectied unit of roughness is merely functional language not lending itself to patentability. However, applicants must recognize that the prior art still teach the a loop reactor having a reactor zone with a smooth surface, or a surface as smooth as possible to reduce fouling. Therefore, the rationale set forth in the office action of June 18, 2007 is adequate for a 103 rejection. Applicants must recognize that "being able to describe the smooth surface of an existing apparatus in a different way" does not lend itself to patentability.
